## 2 problems for 20 pts

Problem 1: BJT Switch

A microcontroller with 5V logic output operates a Darlington switch for a heating element (i.e. a resistor) rated at 24V @ 50W.

(a) Choose the appropriate 5% value for R_B under typical Q1 conditions.

(b) Assuming worst-case Q1 conditions, would a 15 °C/W heat sink be adequate for Q1?

Problem 2: MOSFET Switch

Consider a power MOSFET for the same type of heating element (rated at 24V @ 50W). The control comes from a logic level shifter producing 0 to 10V logic.

(a) Compute the load voltage and load power dissipation under typical Q1 conditions.

(b) Assuming worst-case Q2 conditions, does Q2 need a heat sink?
Standard Resistor Values (±5%)						
1.0	10	100	1.0K	10K	100K	1.0M
