Physics 121 Quiz #2, January 15, 2016

Please show all work, thoughts and/or reasoning in order to receive partial credit. The quiz is worth 10 points total.

I affirm that I have carried out my academic endeavors with full academic honesty.

Suppose that a Fe^{+3} (iron +3e ion) is located at a point P located at $\langle 0, 400, 0 \rangle nm$ in space and that a HF molecule is located at the origin with the H^+ ion located on the negative x-axis and the F^- ion located on the positive x-axis. The magnitude of the dipole moment of HF is $|\vec{p}| = 6.36 \times 10^{-30} Cm$.

- a. What is the electric force on the Fe^{+3} due to the electric dipole HF at the origin?

$$\vec{E} = \left\langle \frac{kqs}{r^3}, 0, 0 \right\rangle = \left\langle \frac{kp}{r^3}, 0, 0 \right\rangle = \left\langle \frac{9 \times 10^9 \frac{Nm^2}{C^2} \times 6.36 \times 10^{-30} Cm}{(400 \times 10^{-9} m)^3}, 0, 0 \right\rangle$$

$$\vec{E} = \langle 0.89, 0, 0 \rangle \frac{N}{C}$$

$$\vec{F} = q\vec{E} = (3e)\vec{E} = (3 \times 1.6 \times 10^{-19} C) \langle 0.89, 0, 0 \rangle \frac{N}{C}$$

$$\vec{F} = \langle 4.29 \times 10^{-19}, 0, 0 \rangle N$$

- b. What is the polarizability of HF ?

$$p = qs = \alpha E \rightarrow \alpha = \frac{p}{E} = \frac{6.36 \times 10^{-30} Cm}{0.89 \frac{N}{C}} = 7.15 \times 10^{-30} \frac{Cm}{\frac{N}{C}}$$

From the literature: <https://www.princeton.edu/~fhs/paper97/paper97.pdf>, the polarizability of HF is $\alpha = 8.20 \times 10^{-31} \frac{Cm}{\frac{N}{C}}$.

- c. Suppose that the Fe^{+3} were replaced by a Cu^{+2} ion located the same point P in space. The net force on the Cu^{+2} ion due to the HF molecule located at the origin would be
1. the same magnitude as the force on the Fe^{+3} ion but in the opposite direction.
 2. the same force as on the Fe^{+3} .
 3. greater for the Cu^{+2} ion than for the Fe^{+3} ion.
 4. lower for the Cu^{+2} ion than for the Fe^{+3} ion.

Physics 121 Equation Sheet

Electric Forces, Fields and Potentials

$$\vec{F} = k \frac{Q_1 Q_2}{r^2} \hat{r}; \quad \hat{r} = \frac{\vec{r}_o - \vec{r}_s}{|\vec{r}_o - \vec{r}_s|}$$

$$\vec{E} = \frac{\vec{F}}{q}$$

$$\vec{E}_Q = k \frac{Q}{r^2} \hat{r}$$

$$\vec{p} = q\vec{s} = \alpha\vec{E}$$

$$|\vec{E}_{\parallel}| = \frac{2kqs}{r^3}; \text{ dipole } r \gg s$$

$$|\vec{E}_{\perp}| = \frac{kqs}{r^3}; \text{ dipole } r \gg s$$

Constants

$$g = 9.8 \frac{m}{s^2}$$

$$1e = 1.6 \times 10^{-19} C$$

$$k = \frac{1}{4\pi\epsilon_o} = 9 \times 10^9 \frac{Nm^2}{C^2}$$

$$\epsilon_o = 8.85 \times 10^{-12} \frac{C^2}{Nm^2}$$

$$1eV = 1.6 \times 10^{-19} J$$

$$\mu_o = 4\pi \times 10^{-7} \frac{Tm}{A}$$

$$c = 3 \times 10^8 \frac{m}{s}$$

$$h = 6.63 \times 10^{-34} Js$$

$$m_e = 9.11 \times 10^{-31} kg = \frac{0.511 MeV}{c^2}$$

$$m_p = 1.67 \times 10^{-27} kg = \frac{937.1 MeV}{c^2}$$

$$m_n = 1.69 \times 10^{-27} kg = \frac{948.3 MeV}{c^2}$$

$$1amu = 1.66 \times 10^{-27} kg = \frac{931.5 MeV}{c^2}$$

$$N_A = 6.02 \times 10^{23}$$

$$Ax^2 + Bx + C = 0 \rightarrow x = \frac{-B \pm \sqrt{B^2 - 4AC}}{2A}$$
