Chapter 15

Questions

- None

Multiple-Choice

15.8 D

15.9 B

Problems

15.1 The equilateral triangle is given as shown. The potential energy is given by the

equation $PE_{1,2} = \frac{kQ_1Q_2}{r}$. Substituting the values given, we find the

$$PE_{total} = 3 \times PE_{1,2} = 3 \times \frac{(9 \times 10^9 \frac{\text{Nm}^2}{\text{C}^2})(3 \times 10^{-6} \text{C})^2}{0.05\text{m}} = 4.86\text{J}.$$

15.4 The relation between electric field and electric potential

- To calculate the potential at any position x , knowing the other position and potential we use the general relation

$$E = -\frac{\Delta V}{\Delta x} \rightarrow 10 \frac{\text{V}}{\text{m}} = -\frac{(V_f - (-15\text{V}))}{10\text{m} - 0\text{m}} \rightarrow V_f = -115\text{V}.$$

- The potential is zero at infinity and also at a distance x given by

$$E = -\frac{\Delta V}{\Delta x} \rightarrow 10 \frac{\text{V}}{\text{m}} = -\frac{(0 - 15)\text{V}}{x_f - 0\text{m}} \rightarrow x = -1.5\text{m}.$$

Chapter 15

Questions

- None

Multiple-Choice

- 15.12 C
15.13 D
15.17 D
15.18 A

Problems

15.3 Electric Potential

- a. $V = \sum \frac{kQ}{r}$ and since equal and opposite charges are equally distant from the observation point at the origin, the two terms add up to zero – remember these are just + and – numbers, not vectors
- b. The electric fields from each charge do not cancel, but both point in the same direction (to the left) since the force from both charges on a positive test charge at the origin is to the left. Adding these up gives $E = 2 \frac{kQ}{x^2}$, where $Q = 10 \mu\text{C}$ and $x = 0.1 \text{ m}$, so $E = 1.8 \times 10^7 \text{ N/C}$, pointing to the left.
- c. Since the potential at the origin is $V = 0$, as it is at infinity (very far away), then there is no change in V for the third charge and therefore no net work is required.

Repeating for two positive charges:

- a. $V = \frac{2kQ}{r} = 1.8 \times 10^6 \text{ V}$;
- b. In this case $E = 0$ since the E fields from each charge point in opposite directions and now cancel;
- c. The net work required is $Q\Delta V = -18 \text{ J}$ or 18 J by an external force.

15.12 The capacitance is given by

$$C = \frac{\kappa\epsilon_0 A}{d} = \frac{1 \times 8.85 \times 10^{-12} \frac{\text{C}^2}{\text{Nm}^2} \times \left(25 \text{mi}^2 \times \left(\frac{1600 \text{m}}{1 \text{mi}} \right)^2 \right)}{1 \text{mi} \times \frac{1600 \text{m}}{1 \text{mi}}} = 3.54 \times 10^{-7} \text{ F}$$

The charge stored is given by $Q = CV = 3.54 \times 10^{-7} \text{ F} \times 50 \times 10^6 \text{ V} = 17.7 \text{ C}$. Finally, the energy stored is given as

$$E = \frac{1}{2} CV^2 = \frac{1}{2} \times 3.54 \times 10^{-7} \text{ F} \times (50 \times 10^6 \text{ V})^2 = 4.43 \times 10^8 \text{ J} = 443 \text{ MJ}$$

15.17 An air-spaced parallel plate capacitor

a. $C = Q/V = 36 \mu\text{C}/12 \text{ V} = 3 \mu\text{F}$

b. The dielectric constant of Pyrex glass is 4.7 (from Table 16.1), so $C = \kappa C_0 = 14.1 \mu\text{F}$

c. Since the capacitance has increased by a factor of 4.7 and V is the same, then Q increases by the same factor to $Q = 169 \mu\text{C}$.

15.22 The charge that flows due to the sodium ions is

$$Q = \frac{50 \text{ channels}}{1 \mu\text{m}^2} \times 100 \mu\text{m}^2 \times \frac{1000 \text{ Na}^+ \text{ ion}}{1 \text{ channel}} \times \frac{1.6 \times 10^{-19} \text{ C}}{\text{Na}^+ \text{ ion}} = 8.0 \times 10^{-13} \text{ C}.$$

The specific capacitance can be related to the capacitance through

$$C = \left(\frac{C}{A} \right) A = \frac{1 \times 10^{-6} \text{ F}}{1 \text{ cm}^2 \times \left(\frac{1 \text{ m}}{100 \text{ cm}} \right)^2} \times 1000 \mu\text{m}^2 \times \left(\frac{1 \text{ m}}{1 \times 10^6 \mu\text{m}} \right)^2 = 1.0 \times 10^{-12} \text{ F}.$$

Therefore the voltage change across the membrane due to the ion flow is given by

$$Q = CV \rightarrow \Delta V = \frac{\Delta Q}{C} - 100 \text{ mV} = \frac{8.0 \times 10^{-13} \text{ C}}{1.0 \times 10^{-12} \text{ F}} - 100 \text{ mV} = 0.8 \text{ V} - 100 \text{ mV} = 700 \text{ mV}.$$

15.23 The energy in a charged capacitor is given by

$$E = \frac{1}{2} CV^2 \rightarrow V = \sqrt{\frac{2E}{C}} = \sqrt{\frac{2 \times 300 \text{ J}}{30 \times 10^{-6} \text{ F}}} = 4470 \text{ V}$$
